

Department of Applied Mathematics
PROBABILITY AND STATISTICS PRELIMINARY EXAMINATION
January 2020

Instructions:

Do two of three problems in each section (Prob and Stat).
Place an **X** on the lines next to the problem numbers
that you are **NOT** submitting for grading.

Prob
1. ____
2. ____
3. ____

Do not write your name anywhere on this exam.

Stat

- (b) What's the probability that after a very long time the machine is working? Explain!
 - (c) If the machine is currently working, what's the probability it continues doing so without interruptions during the next t units of time? Explain!
 - (d) If the machine is currently working, what's the probability that it is working t units of time later? Justify!
-

Problem 3.

Let r_0, r_1, r_2, \dots be real numbers such that $r_i > 0$, and $\sum_{i=0}^{\infty} r_i = 1$.

Consider a discrete-time homogeneous Markov chain $X = (X_n$

(d) It is well known that Y_1 , as the minimum of n exponentials with rate λ , has again an exponential distribution but with rate $n\lambda$. One can show that Y_2 has the same distribution as $E_1 + E_2$, where E_1 and E_2 are independent with $E_1 \sim \exp(\text{rate} = n\lambda)$ and $E_2 \sim \exp(\text{rate} = (n-1)\lambda)$.

(b) Suppose that X_1, X_2, \dots, X_n is a random sample from the distribution with pdf

$$f(x; \theta) = x^{-1} I_{(0,1)}(x).$$

Use part (a) to derive an approximate 100(1 -
